LXD
LEARNING BY DESIGN AI

The AI capability loop

Start with one workflow. Build the brain. Every layer you add creates the need for the next, and token spend has to keep falling the whole way. We build each layer before you hit the wall.

Five layers, one loop

Each step unlocks something, and creates the next problem

IN PARALLEL, ALWAYS

Token spend, optimised continuously

Every day
Route routine steps to small models, cache repeated context, keep every connector green.

Every 3 months
Review the top token sinks and new model prices. Retire what nobody uses.

Every 6 months
Rebuild the expensive paths: batch them, precompute them, serve them from cache.

Result: cost per task falls as usage grows. One startup went from $2,000 to $300 a month.

WHERE ARE YOU ON THE LOOP?

Everyone uploads the same docs into every chat	01
Same task, done five ways by five people	02
Prompts copied from a doc and run by hand	03
A workflow stuck in chat that needs screens	04
Sales says $1M revenue, finance says $500K	05
The AI bill grows faster than usage	Parallel

BUILT, NOT THEORIZED

Vet talent marketplace — Start
One workflow first: an ads agent live in two weeks, 500+ ads pushed.

Investment bank, medical science — 01 to 03
8 source systems in one brain, 58 skills on top. Analysts ask in plain language.

US retail real estate developer — 01 to 04
Every CRM and data source in one brain. Non-engineers build their own apps.

AI workflow platform — 02 to 05
Shared skill, access and semantic layers, so anyone ships an app.

40-MIN SESSION Walk the loop with live builds, the mistakes we see at each step, and how to tell where your team is today.
